## Experience

**Niantic (8th Wall Acquisition)** Palo Alto, CA

*Senior Software Engineer, Technical Lead Manager (AI)* *May 2025 — Present*

- Technical lead and engineering manager for 8th Wall's AI team, growing the team from 1 to 6 engineers across ML and full-stack and setting the AI roadmap for Niantic Studio.
- Launched 8th Wall Agent, a VS Code-compatible multimodal AI agent with a built-in MCP server that generates idiomatic 8th Wall code and edits proprietary scene graphs and prefabs, doubling the addressable user base and increasing daily active developers by 20%.
- Launched 8th Wall Asset Lab, AI tooling for text-to-image, image-to-image, and text-to-3D workflows in Niantic Studio, cutting project development time 50%, opening a new revenue stream, and making users 2.7x less likely to churn.
- Fine-tuned Qwen-2.5-Coder 7B and 32B on 25K+ prompt/code pairs with PyTorch and Hugging Face, improving code generation quality to 55% Pass@3, 15 points above prompt-engineered baselines.

*Senior Software Engineer (Infrastructure and AI)* *Feb 2024 — May 2025*

- Architected and launched Niantic Studio Backend Services, a patented client/server platform that deploys version-pinned backend functions into application-specific serverless environments, securing API keys and game logic while eliminating up to a week of separate infrastructure setup.
- Built AI platform services on AWS Bedrock and AppSync, including real-time streaming APIs, prompt caching, LLM evaluation workflows, shared auth middleware, and credit accounting that powered agentic features in Niantic Studio.
- Created an edge logging API on Lambda@Edge, Kinesis, and Lambda that accepted JSON payloads, validated and serialized them into protobuf at runtime, and piped application telemetry into Niantic's data warehouse.

*Software Engineer (Infrastructure)* *Mar 2022 — Feb 2024*

- Re-architected the highest-traffic request path for user-built apps from 6 regional application clusters backed by Postgres read replicas to a global Lambda@Edge architecture backed by CDC-replicated DynamoDB, cutting AWS spend by 20% and reducing latency worldwide.
- Created a durable change data capture (CDC) platform that became a core internal service at 8th Wall for marketing systems, analytics, abuse detection, edge replication, and state synchronization workloads.
- Built an authorized WebSocket platform and companion client library for synchronizing shared state across users in 8th Wall's developer console without polling.
- Introduced AWS CDK as infrastructure as code for the team, enabling service owners to define and ship their own stacks, reducing backend bottlenecks and accelerating infrastructure delivery.

**8th Wall** Palo Alto, CA

*Software Engineer II (Full Stack)* *Jul 2021 — Mar 2022*

- Engineered search and discovery infrastructure powering all major content surfaces on 8thwall.com, including search APIs, indexing pipelines, ranking algorithms, and OpenSearch tuning.
- Built an at-request-time image transformation service on Lambda@Edge, CloudFront, and S3 that improved asset performance and reduced frontend complexity.
- Owned billing systems integrating Stripe for subscriptions, payments, and account lifecycle workflows.

*Software Engineer (Full Stack)* *Jun 2020 — Jul 2021*

- Built a Chrome DevTools-like console in 8th Wall's Cloud Editor with live build status, expandable linked stack traces, and reversible command history search.
- Shipped creator-facing profile, project, and code-sharing features that expanded public discovery and user-generated content across the platform.

**Lawrence Livermore National Laboratory** Livermore, CA

*Software Engineer Intern (Full Stack)* *May 2019 — Aug 2019*

- Built an internal web application for scientists to store and distribute classified information.
- Developed Flask and MongoDB APIs with bulk fetch and pagination to streamline file management workflows.

## Projects

**k9 monorepo** (github.com/kyletruong/k9) *Jul 2025 — Present*

- Built a multi-tenant Cloudflare Sandbox service that provisions isolated per-user, per-repo environments and proxies AI coding agents against live GitHub repositories.
- Built an edge-cached Open Graph rendering pipeline that derives previews from the route tree and asynchronously populates the Cloudflare cache.
- Standardized monorepo developer workflow with Turbo watch pipelines, type-aware linting, and shared UI packages to keep multiple apps moving together.

## Patents

**Integrated client-side and server-side application development** *Dec 2025 (Publication Date)*

- Publication Number: US 20250377887 A1
- Assignee: Niantic

## Education

**California State University, East Bay** Hayward, CA

*Bachelor of Science, Computer Science* *2018 — 2020*

- GPA: 3.898/4.0 (Dean's List)

**Foothill College** Los Altos Hills, CA

*Transfer Coursework* *2017 — 2020*
